SIMON HARRINGTON

EDUCATION

Whitman College — Walla Walla, WA — August 2024 – present
Majoring in Computer Science/Pre-Engineering with a Math minor in a 3+2 transfer program, completing three years at Whitman before transferring for two years; current GPA of 3.85. Transferring May 2027, expected graduation 2029.

TECHNICAL SKILLS

Languages: C++, C#, Java, Python (PyTorch, numpy, OpenCV), TypeScript
Frameworks and tools: Unreal Engine, .NET, Win32/GDI+, React Native, Expo, Git, Bash

EXPERIENCE

Freelance Software Engineer — DataAnnotation, Remote — June 2026 – present
Evaluate and stress-test frontier AI models on realistic software engineering tasks. Design difficult but clearly specified tasks for an agent to fail against, then create a solution with the help of a second frontier model. Review other contributors' submissions. Work spans multiple languages and requires justifying all judgements.

Course Designer and Instructor — Whitman College — November 2024 – October 2025
Designed a for-credit course on sustainable transportation with one other student under faculty supervision, wrote an original curriculum consisting of ten 80 minute class periods and a final project. Conducted in-depth research on the topic, condensed it into easy-to-understand presentations, then taught the course to 15 Whitman students in the fall of 2025 and facilitated class discussions.

Pier Agent — SMS International Shore Operations, Seattle WA — Summers 2022–2024
Checked in and directed cruise passengers through security and embarkation, and assisted travelers through high-stress situations such as being late for departure or being turned away for missing passports or vaccinations.

PROJECTS

N-Body Simulation — C++, Win32, GDI+ — October – November 2025, team of 2 — N-Body-Problem-2D-Collab
Gravitational n-body simulator for 2–15 bodies, built on a from-scratch forward-Euler initial-value-problem solver using fully accurate physical constants. Built the UI and visual layer, playing/replaying solved trajectories at 30 FPS over a configurable 10^6 m/pixel scale. Extended the solver to take user settings like body count, relative speed, simulation length and steps per simulated second, and pair-programmed the solver.

Grades App — TypeScript, React Native, Expo, Canvas REST API — March – May 2026, solo — grades-app
Mobile grade tracker adding what-if grades, a feature the Canvas mobile app lacked. Calculates weighted category grades and GPA, and schedules local notifications a configurable interval before each due date.

Flower Defense — Unreal Engine, C++ — May – August 2025, lead programmer, team of 2 — Farming_Tower
Unreal tower defense written in C++ rather than Blueprints, released on itch.io. Implemented four tower types, five projectile classes including mortar projectile trajectory calculation, grid-based tower placement, and a weather system with floods that reshape the buildable area between rounds.

Valorant Overlay — C#, .NET — January – February 2026, solo — valorant-cosmetic-overlay
Borderless always-on-top overlay that reacts to in-game events, sampling a line of screen pixels twice a second to detect kills and weapon swaps without using a game API because Valorant's anticheat blocks process access.

Image Classification — Python, PyTorch, OpenCV — March 2026, solo — image-classification
Classifies webcam frames into eight hand gestures using a ResNet-18 implemented from scratch. Captured and labelled the dataset of 25,184 frames at 12 FPS, then augmented it in OpenCV with randomised contrast, brightness and JPEG compression (doubling the set to 50k frames). Trained 60 epochs in pytorch.
