SIMON HARRINGTON

EDUCATION

Whitman College — Walla Walla, WA — August 2024 – present
Majoring in Computer Science/Pre-Engineering with a Math minor in a 3+2 transfer program, completing three years at Whitman before transferring for two years; current GPA of 3.85. Transferring May 2027, expected graduation 2029.

TECHNICAL SKILLS

Languages: C++, C#, Java, Python (PyTorch, numpy, OpenCV), TypeScript
Frameworks and tools: Unreal Engine, .NET, Win32/GDI+, React Native, Expo, Git, Bash

EXPERIENCE

Freelance Software Engineer — DataAnnotation, Remote — June 2026 – present
Evaluate and stress-test frontier AI models on realistic software engineering tasks. I design difficult but clearly specified tasks for an agent to fail against, then create a solution with the help of another frontier model. I also review other contributors' submissions. Work spans multiple languages and requires justifying all judgements.

Course Designer and Instructor — Whitman College — November 2024 – October 2025
I worked with one other student under faculty supervision to create a for-credit course about sustainable transportation and created an original curriculum consisting of ten 80 minute class periods and a final project. I conducted in-depth research on the topic and condensed it into easy-to-understand presentations, then taught the course to 15 Whitman students in the fall of 2025 and facilitated class discussions.

Pier Agent — SMS International Shore Operations, Seattle WA — Summers 2022–2024
I checked in and directed cruise passengers through security and embarkation at Pier 91, and assisted travelers through high-stress situations such as lost luggage, being late for departure, and being turned away for missing passports or vaccinations.

PROJECTS

N-Body Simulation — C++, Win32, GDI+ — October – November 2025, team of 2
Gravitational n-body simulator with a from-scratch initial-value-problem solver that uses fully accurate physical constants. I built the UI and visual layer, extended the solver to take user settings like body count, relative speed, simulation length and time dilation, and pair-programmed the solver.

Grades App — TypeScript, React Native, Expo, Canvas REST API — March – May 2026, solo
Mobile grade tracker adding what-if grades, a feature the Canvas mobile app lacked. Calculates weighted category grades and GPA, and schedules local notifications a configurable interval before each due date. I shelved it after no institution would issue a developer key, limiting it to personal access tokens.

Flower Defense — Unreal Engine, C++ — May – August 2025, lead programmer, team of 2
Unreal tower defense written in C++ rather than Blueprints, released on itch.io. Grid-based tower placement and mortar projectile trajectory calculation. Specifying the grid system against the rest of the game before building it is what let us finish a complete game.

Valorant Overlay — C#, .NET — January – February 2026, solo
Borderless always-on-top overlay that reacts to in-game events, sampling a line of screen pixels twice a second to detect kills and weapon swaps without using a game API.

Image Classification — Python, PyTorch, OpenCV — March 2026, solo
Classifies webcam frames into eight hand gestures using a ResNet-18 implemented from scratch. Captured and labelled the dataset myself, then augmented it in OpenCV with randomised contrast, brightness and JPEG compression.
